## VNK BA10VS

Axial piston pump BA10VS in swashplate design is used for hydrostatic transmissions in open loop circuits. Flow is proportional to drive speed and displacement. By adjusting the position of the swashplate it is possible to smoothly vary the flow.

- Variable displacement axial piston pump of swashplate design for hydraulic open circuit systems.
- Flow is proportional to drive speed and displacement. It can be infinitely varied by adjustment of the swashplate.
- ISO mounting flange.
- Flange connections to SAE metric.
- 2 Case drain ports.
- Good suction characteristics.
- Permissible continuous pressure 28MPa.
- Low noise level.
- Long service life.
- Quick response time
- Axial and radial loading of drive shaft possible.
- High power-weight ratio
- Wide range of controls
- Through drive option for Multi-circuit system.

## TECHNICAL DATA

### 1. Input operating pressure range

Absolute pressure at port S (A)

## FLUID

The VNKBA10VSO variable displacement pump is suitable for use with mineral oil.

### 1. Operating viscosity range

We recommend that the operating viscosity (at operating temperature) for both the efficiency and life of the unit, be chosen within the optimum range of

$V_{opt}$  = opt. operating viscosity 80...170 SUS (16...36 mm<sup>2</sup>/s)

### 2. Viscosity Limits

The limiting values for viscosity are as follows:

$V_{min}$  = 10mm<sup>2</sup>/s short term at a max. permissible case temperature of 90°C

$V_{max}$  = 1000mm<sup>2</sup>/s short term on cold start

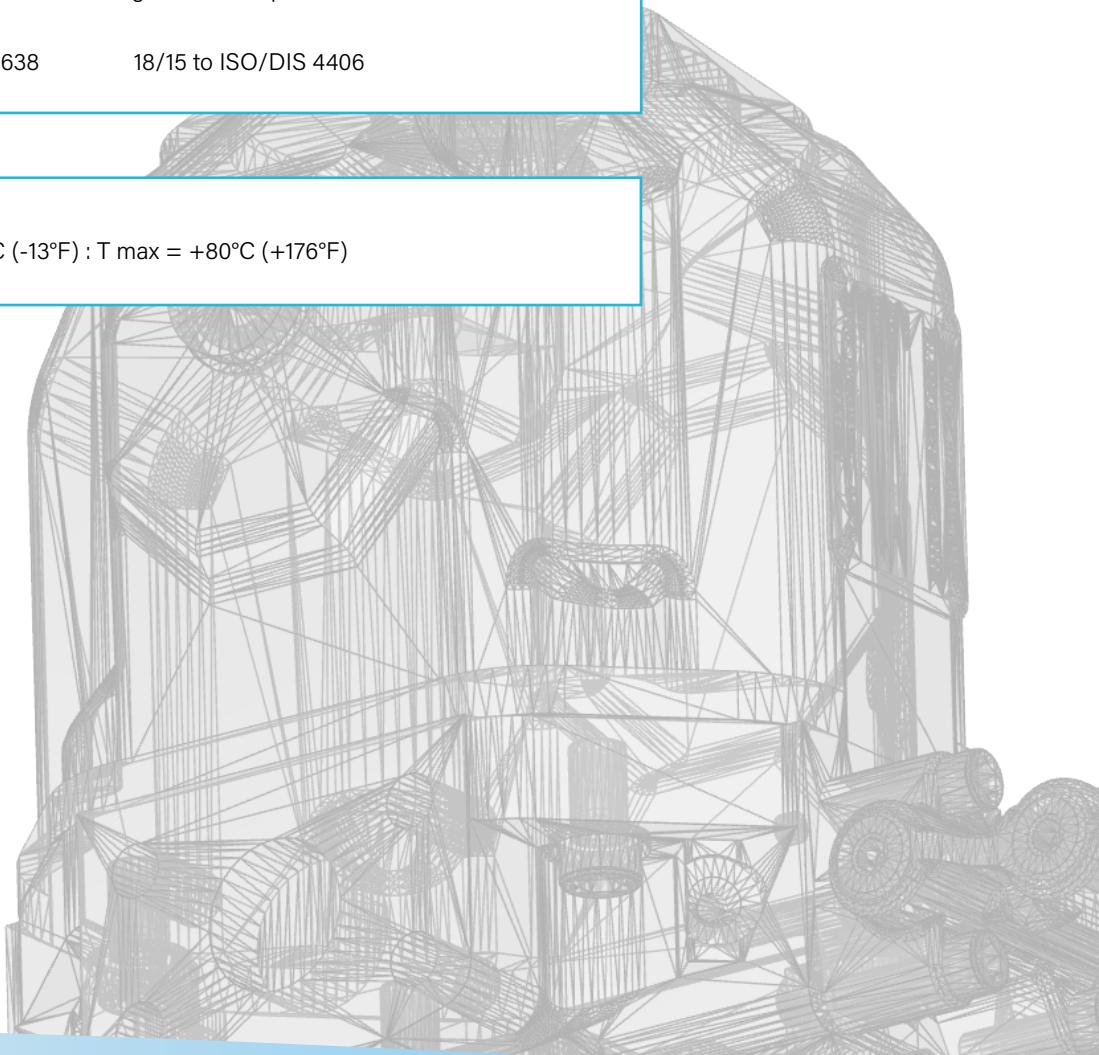

### 3. Filtration

The finer the filtration, the better the achieved cleanliness of the pressure fluid and the longer the life of the axial piston unit. To ensure the functioning of the axial piston unit a minimum cleanliness level of:

9 to NAS 1638      18/15 to ISO/DIS 4406

### 4. Temperature range

T min = -20°C (-13°F) : T max = +80°C (+176°F)

## NOISE LEVEL

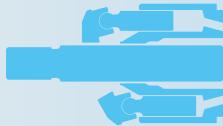

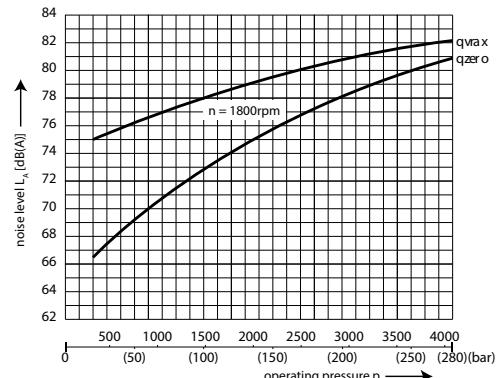

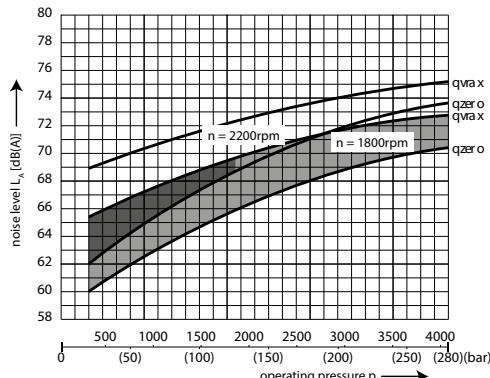

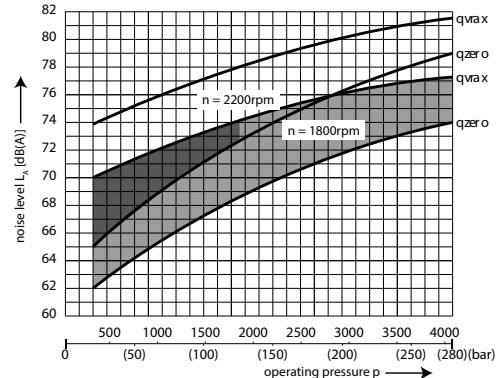

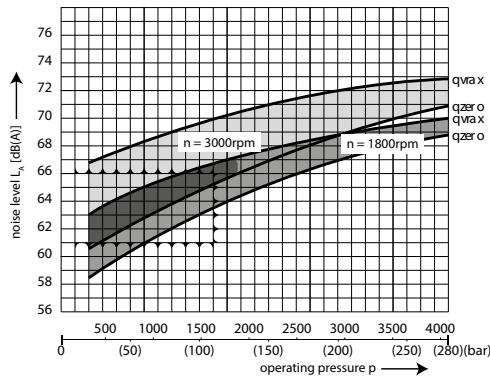

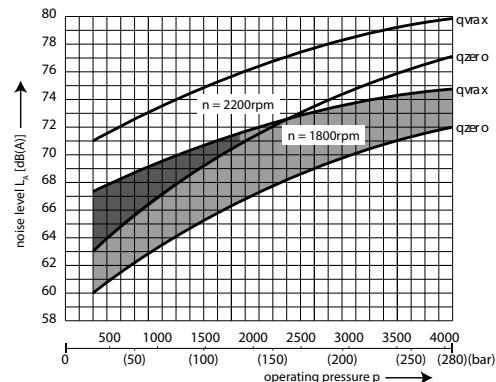

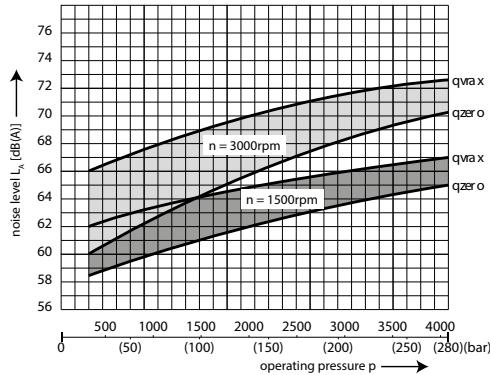

### Characteristics for Pumps

Measured in a Sound Chamber

Distance from microphone to pump = 3.3 ft (1 m)

Measuring error: +2 dB (A)

Fluid: Hydraulic oil to ISO VG 46 DIN 51519, t = 122°F (50°C)

## DR Pressure Control

The pressure control serves to maintain a constant pressure in the hydraulic system within the control range of the pump.

The pump therefore supplies only the amount of hydraulic fluid required by the actuators. Pressure may be smoothly set at the pilot valve.

## DRG Pressure/ Remote Control

A pressure relief valve may be externally piped to port X for remote control purposes. It is not, however, included with DRG control.

The differential pressure at the pilot valve is set as standard to 20 bar (290 psi) and this results in a pilot flow of (0.4gpm) 1.5 L/min. If another setting is required (in the range 10-22 bar), please state this in clear text.

## DFR/DFR1 Pressure/ Flow Control

In addition to the pressure control function, the pump flow may be varied by means of a differential pressure at the actuator (e.g. an orifice).

In model DFR1 the X orifice is plugged.

## DFLR Pressure/Flow/ Power Control

In order to achieve a constant drive torque with a varying operating pressure, the swivel angle and with it the output flow from the axial piston unit is varied so that the product of flow and pressure remain constant.

Flow control is possible below the limit of the power curve.

The power characteristics is factory - set, so please enter details in clear text, e.g. 20kW at 1450 rpm (5HP, 1800RPM).

## Through Drive

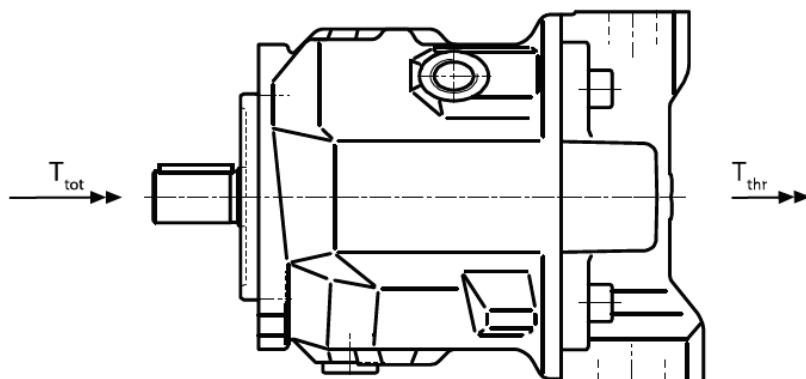

### Through Drive Mounting Options

#### Shaft Torque Data

Axial piston units BA10V can be supplied with a through drive as shown in the ordering code on page. The type of through drive is determined by codes (KB3-KB6). If the combination pump is not mounted in the factory, the simple type of code is sufficient.

Included in this case are: shaft coupler, seals, and if necessary an adapter flange.

Maximum permissible input and through drive torque.

The drive torques for pump 1 and pump 2 can be split up as required. However the max. permissible input torque  $T_{tot}$  as well as the max. permissible though drive torque  $T_{thr}$  may not be exceeded.

Max. perm. input torque $T_{tot}$			18	28	45	71	100	140
With shaft U	$T_{tot}$	lb.ft (Nm)	43 (59)	- (-)	139 (188)	- (-)	439 (595)	- (-)
